

OpenRMS

Report Management System

There exists a wealth of information within modern control systems. This abundant amount of real-time and historical data is often compiled into system reports using third-party report building tools for delivery to users. Due to the volume of available information, the challenge is to deliver system reports to the corporate and operations users who need them, in a timely and convenient manner.

OSI's Report Management System, **OpenRMS™** is a report and documentation management system that provides secure access to centralized reports and documents through a single web-portal interface.

OpenRMS allows automatic conversion from report building programs such as Microsoft® Excel, Microsoft® Access or SAP® Crystal Reports, to PDF format for users who do not natively support these applications. In addition to manual access through the web-portal interface, **OpenRMS** allows users to schedule reports and documents to be periodically distributed via e-mail to specific users or groups.

For reports that require input such as date or keyword search criteria (e.g. station name, plant name, etc.), **OpenRMS** automatically detects the available input parameters, presents the parameters to the user, prompts for selection, generates the report and presents the new report to the user. Administration of reports with **OpenRMS** is protected by authorization, utilizes a drag and drop interface and supports a large number of report groupings and templates.

With security as a paramount concern, **OpenRMS** supports current IT standard practices such as Kerberos and Active Directory. Additionally, **OpenRMS** includes features such as User Permission Groups and Permission Matrix Templates, making user management as secure and effortless as possible.

Salient features of **OpenRMS** include:

- Secure access to documents and reports for corporate users
- Web-portal Interface application (thin client) can easily be made available to a large number of users
- PDF format allows users to view documents and reports, independently of the applications used to generate them

- Automatic document and report distribution
- Document and report scheduling subsystem
- Report templates for easy report creation via the web-portal interface
- Standard drag and drop functionality
- Based on the Microsoft® .NET Framework

Available independently of the monarch™ platform, **OpenRMS** is a feature-rich, web-based portal application that offers efficient report and documentation management to utilities looking to disseminate system reports, work orders, operations manuals, training or media and other files throughout the enterprise. **OpenRMS** fits well within an environment where a thin-client with simple applications installation, maintenance and user access is desirable.
